

Assignment - 1

①

After converting all of em to lower case

$\Rightarrow \text{list} = [\text{'atom'}, \text{'animals'}, \text{'and'}, \text{'are'}, \text{'cats'}, \text{'cute'}, \text{'dope'}, \text{'funny'}, \text{'get'}, \text{'nearly'}]$

dimension = 10 \rightarrow 10 unique word.

$$\frac{S}{2} = 9$$

$\text{Vec a} = [0, 1, 0, 1, 1, 1, 0, 1, 0, 0]$

$\text{Vec b} = [0, 1, 0, 1, 0, 0, 1, 1, 0, 0]$

$\text{Vec c} = [1, 0, 1, 0, 1, 1, 0, 1, 1, 1]$

Matrix = $\begin{bmatrix} 0 & 0 & 1 & 1 & 1 & 1 & 0 & 1 & 0 & 0 \\ 0 & 1 & 0 & 1 & 0 & 0 & 1 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 0 & 0 & 0 & 1 & 1 & 0 \\ 0 & 1 & 1 & 0 & 0 & 1 & 0 & 0 & 1 & 1 \\ 1 & 0 & 1 & 0 & 1 & 0 & 1 & 0 & 1 & 1 \\ 0 & 0 & 1 & 1 & 0 & 1 & 1 & 0 & 0 & 1 \\ 0 & 1 & 0 & 0 & 1 & 1 & 0 & 1 & 1 & 0 \\ 1 & 1 & 0 & 0 & 1 & 0 & 1 & 1 & 0 & 1 \\ 0 & 0 & 1 & 0 & 1 & 1 & 1 & 0 & 1 & 0 \\ 1 & 0 & 1 & 1 & 0 & 0 & 1 & 0 & 1 & 1 \end{bmatrix}$

②

$P(\text{cat}) = P$ for word cat in 10 words

$P(\text{not cat}) = 1 - P \hookrightarrow (1 - P)^{10}$

$P(\text{at least 1 cat}) = 1 - P(\text{not cat})$

$$\hookrightarrow 1 - (1 - P)^{10}$$

if an expression has length L

then $\rightarrow [1 - (1 - P)^L]$

Total no of words in the corpus = 15

Probability vector = $[0.067, 0.067, 0.133, 0.133, 0.067, 0.133, 0.133, 0.067, 0.067]$

Cat \rightarrow 2 times

$$P = \frac{2}{15}$$

$$P(\text{Post A being cat type}) = [1 - (1 - \frac{2}{15})^5] \rightarrow 1 - \left(\frac{13}{15}\right)^5 \rightarrow 0.52$$

$$\rightarrow 52\%$$

2 cat type posts \rightarrow A and C \rightarrow 2

Now we find the probability if a post contain cube and it is a cat type post.

a post contain cube and it is a cat type post.

$$\cancel{P(\text{cube} / \text{cat type})} \Rightarrow P(A/B) = P(\text{cat type} / \text{cube})$$

$$\Rightarrow \frac{P(B/A) \cdot P(A)}{P(B)} \quad P(B/A) = P(\text{cube} / \text{cat type})$$

\rightarrow Post \rightarrow cat type

A \rightarrow contains cube

$$P(B/A) = 1/2$$

$P(A) \rightarrow$ cat type

total \Rightarrow posti

2 posti A and C cat type
 $\hookrightarrow \frac{2}{3}$

$P(B) \rightarrow P(\text{cate}) \Rightarrow \frac{1}{3}$ ^{only A}

$$\frac{\frac{1}{2} \times \cancel{\frac{2}{3}}}{\cancel{\frac{1}{3}}} \Rightarrow 1$$

$$\rightarrow \underline{100\%}$$

so $P(\text{cate}/\text{cat}) = \frac{1}{2}$ $P(\text{Cat}/\text{cate}) = 1$

③ upvotes

$$v(l) = -\frac{l^2}{20} + 3l$$

$$\frac{dv(l)}{dl} \Rightarrow -\frac{1}{10} + 3 \quad \boxed{10 = 30}$$

$$\frac{d^2v}{dl^2} = -\frac{1}{10} < 0 \quad @ l=30 \text{ func is max}$$
